

RYNAUT - FREE TOOL

Agent Testing Contract Checker

HOW TO USE - BUYER GUIDE

Free - 8 Questions, 2 Minutes

RYNAUT

What this is

An interactive self-assessment that scores your AI agent's test coverage across the 8 dimensions that actually break in production: output contracts, error paths, hallucination detection, adversarial inputs, continuous CI evals, end-to-end integration, deterministic replay, and cost/latency budgets. For every gap, you get a specific fix - not vague advice.

Who it's for

Engineers and teams putting LLM agents into production who want an honest, fast read on whether their tests are real.

How to run it

1. Open the checker in a browser. Answer 8 Yes/No questions about your current test suite.
2. Answer for what you actually have today, not what you intend to build.
3. Read your score (out of 8) and risk grade on the results screen.
4. Review the gap analysis - each failed item expands into a concrete fix.
5. Click 'Save as PDF' to keep your gap report; 'Copy Results' to paste into a ticket or standup.

How to read your results

Your grade ranges from Critical Risk (running on trust, not tests) to Solid Coverage. Each gap names the exact failure mode it prevents and the tool or pattern that closes it (Pydantic contracts, mocked tool failures, LLM-judge factuality, adversarial fixtures, CI evals, LangGraph replay, token/latency assertions).

How to act on your results

- Open the included starter kit (`agent_test_contract_starter.py`) - it contains runnable Pydantic + pytest patterns for 6 of the 8 gaps. Run: `pytest agent_test_contract_starter.py -v`
- Drop `ci-eval.yml` into `.github/workflows/` to close the continuous-eval and integration gaps.
- Re-take the checker after a sprint to confirm gaps are closed.
- Choosing eval tooling next? Use the Rynaut LLM Evaluator Stack Selector.

FAQ

Q: Does the email capture send my data anywhere?

A: In the shipped file it is a front-end stub - wire it to your Beehiiv/ConvertKit API to collect emails. Until then nothing is transmitted.

Q: Is the starter code production-ready?

A: It is a teaching scaffold with real patterns. Adapt the stubs (`run_agent_stub`) to your agent.

Q: What license is the code?

A: MIT - use freely in your own projects.
